European Launch Vehicle Ariane 6: Fraunhofer IWU and ESA Deploy Innovative Sensor Technologies Across All Production Sites

On November 4, an Ariane 6 rocket successfully carried the Earth observation satellite Sentinel-1D into orbit. Looking ahead, the new launch vehicle is expected to lift off at short intervals, allowing Europe to remain a key player in space research. A perfectly synchronized production network that manufactures components with the highest precision is essential for aerospace applications. Sensors can play a crucial role here—from physical traceability of parts to condition monitoring and quality management. Advanced sensor technology also helps make energy consumption in production more manageable.

Following a successful pilot phase, Fraunhofer IWU and the European Space Agency (ESA) are now rolling out four sensor groups to all Ariane production sites as part of the SmartSENS project. “The goal is to consolidate all data on a single platform (ESA-Stream) and analyze it to enable closed-loop quality control,” explains Dipl.-Ing. Albrecht Hänel, Head of the Digital Production Twin Department at Fraunhofer IWU and project manager at the institute. Sensors known as asset trackers monitor the availability, condition, and location of production equipment and resources, as well as key manufacturing processes, in real-time. Monitoring vibrations during processing provides valuable insights into product quality via process stability. GPS trackers enable complete traceability of parts and components on their way into the factories, during further processing, and on their way to (final) assembly. A fourth category of sensors tracks energy consumption during production, helping to keep the manufacturing-related CO₂ footprint as low as possible.

IMPROVE: Getting Better

SmartSENS is part of the ESA program “IMPROVE! – Technologies for Smart Manufacturing, Intelligent Logistics and Sustainability.” The program’s initiatives aim to create a fully automated and intelligent end-to-end value chain for the Ariane 6 launch vehicle and the P120C rocket engine. The focus lies on groundbreaking innovations in predictive maintenance, connected sensor networks, digital supply-chain management, and sustainable production processes.

A Living Partnership

November 21, 2025 || Page 2 | 2

Fraunhofer IWU and AS Consulting launched SmartSENS in May 2025. In the first phase, the sensor technologies were tested and validated in a real production environment at MTA Augsburg. The solutions in use include energy and vibration sensors from ABB, Brady systems for real-time asset traceability, and GPS trackers from Trusted A/S for transport monitoring. Production partners now receiving the rollout include, for example, ArianeGroup (Vernon, France), Avio S.p.A. (Colleferro, Italy), GKN Aerospace Sweden AB (Trollhättan), and ATC Space s.r.o. Klatovy (Czech Republic).

The **Fraunhofer Institute for Machine Tools and Forming Technology IWU** is an innovation-driven partner for research and development in production engineering. Around 670 highly qualified employees work at our locations in Chemnitz, Cottbus, Dresden, Leipzig, Wolfsburg, and Zittau. We unlock potential for competitive manufacturing, across industries like automotive, aerospace, electrical engineering, and precision engineering. Our research and contract research encompass the entire manufacturing ecosystem, from individual components to processes, methods, complex machine systems and human interaction. As one of the leading institutes for resource-efficient manufacturing, we bank on highly flexible, scalable cognitive production systems using nature as an example. We take a holistic approach to the entire process chain, aligning with circular economy principles. We develop technologies and intelligent production plants and optimize forming, cutting, and joining manufacturing steps. Our services include innovative lightweight structures and technologies for processing new materials, functional transfer to assembly groups, and the latest technologies of additive manufacturing (3D printing). We provide solutions for climate-neutral factory operations and large-scale production of hydrogen systems, thus paving the way for the transition to renewable energies.
